# IMAGINiT Clarity Owner Data Portal

Jump the gap between building information modeling and facilities management.

Whether you're a facilities manager or construction professional, IMAGINiT Clarity Owner Data Portal can remove barriers to Autodesk® Revit® data, making your model more valuable to owners.

IMAGINiT Clarity Owner Data Portal:

■ Makes information accessible to non-Revit users

■ Integrates Revit data with existing facilities management systems

■ Generates building-centric reports automatically, including room, equipment, and furniture specific reports

■ Enables round trip editing of data, so changes made in Clarity Owner Data Portal can be sent back into the Revit model.

Connect with Other Facilities Management Systems Using a Standard Repository

Standard Revit models are not well suited to integrate with facilities management systems. As a result, the valuable model data in those models is often underutilized. Clarity Owner Data Portal offers:

■ A repository for building model information that is easily accessed by building owners and other project stakeholders

■ Automated generation of COBie export files for integration into other systems

■ Direct integration with ARCHIBUS and ProjectWise

■ Powerful 3D viewer which can be leveraged behind a firewall

■ Integration with Autodesk BIM 360

Generate Room, Equipment, and Furniture Reports Automatically

Find the data you need, quickly by drawing on data in Revit models. You can generate many reports with IMAGINiT Clarity Owner Data Portal including:

- ■ Lists of all rooms, equipment, and furniture

- ■ Rooms by floor, department, category, type, and standard

- ■ Equipment by standard, system, and other parameters

- ■ Furniture by standard

- ■ Multiple or cross-building reporting

Liberate Information from Revit Models

IMAGINIT Clarity Owner Data Portal understands that building operators need quick access to accurate data from the current building model. The system runs on top of Autodesk Revit and is built to open up rich data contained in Revit models to building owners.

Reports can be edited on the fly, without modifying or jeopardizing the integrity of the source data. In addition, Clarity Owner Data Portal supports "round trip editing." Users can request changes to model data from the Clarity Owner Data Portal and send those edits back to the Revit model owner without needing to know the Revit program.

Beyond just providing reports to non-Revit users, IMAGINiT Clarity can help organizations learn more about their projects with analytics, including the ability to move Revit data into a SQL environment for business intelligence analysis.
